

Activity 12 — Portfolio Building

Building Your Portfolio Blog by Prompting an AI Assistant

1. Portfolio Brief

I am Ujjwal GD, a second-year B.Tech Computer Science and Information Technology student in my 3rd semester. I am building my foundation in programming, problem solving, software development, and collaborative development practices. Through my coursework and practical activities, I have been working with C, C++, Python, HTML, CSS, JavaScript, SQL, Git, and GitHub.

My earlier portfolio activities gave me practical experience rather than only classroom notes. In Activity 1, I created a Hello World C repository and used GitHub to keep a simple working program as a public artifact. This helped me connect a basic programming exercise with version control and a real online repository.

In Activities 2 and 3, I worked with Git and GitHub and practiced collaboration through pair programming using GitLens and Live Share. The collaboration activity helped me understand that software development is not only about writing code individually; it also involves sharing work, communicating changes, reviewing what another person is doing, and keeping a clear development history.

In Activity 4, I created my LeetCode solutions repository to document my problem-solving practice. The repository contains my solutions and supporting documentation, giving me a place to track my progress while practicing programming and data-structure/problem-solving questions. The repository is available at: <https://github.com/ujjwal200612-sketch/leetcode-solutions>

My Hello World repository is available at: <https://github.com/ujjwal200612-sketch/hello-world-c>

My current skills include C programming, C++ fundamentals, Python basics, HTML/CSS/JavaScript fundamentals, SQL, problem solving, Git and GitHub, and collaborative development with GitLens and Live Share. I am also developing my understanding of data structures, algorithms, and machine-learning/data-science workflows through academic and personal practice.

My main learning goal is to become a stronger software developer by improving my problem-solving ability, building more complete projects, and becoming comfortable with development tools and collaborative workflows. Over time, I want to turn my academic exercises into projects that demonstrate what I can actually build and learn.

2. Initial Generation Prompt

Create a one-page personal portfolio blog for Ujjwal GD, a second-year B.Tech Computer Science and Information Technology student in the 3rd semester. Use the following verified information and do not invent projects, achievements, employers, awards, skills, or personal details. About me: - Name: Ujjwal GD - Education: B.Tech Computer Science and Information Technology - Current level: 2nd year, 3rd semester - I am developing skills in programming, problem solving, software development, Git/GitHub, and collaborative development. Prior activities/projects: 1. Hello World C repository from Activity 1: <https://github.com/ujjwal200612-sketch/hello-world-c> It is a simple first C programming artifact stored publicly on GitHub. 2. Pair-programming collaboration from Activities 2–3: I practiced collaborative development using Git/GitHub, GitLens, and Live Share. The experience focused on sharing work, communicating changes, and understanding collaborative coding workflows. 3. LeetCode solutions repository from Activity 4: <https://github.com/ujjwal200612-sketch/leetcode-solutions> It documents my LeetCode problem-solving practice and solutions. Skills: - C - C++ fundamentals - Python basics - HTML, CSS and JavaScript fundamentals - SQL - Git and GitHub - Problem solving - Data structures and algorithms fundamentals - Collaborative development with GitLens and Live Share Career/learning goal: I want to become a stronger software developer by improving problem-solving skills, building complete projects, and becoming comfortable with modern development and collaboration tools. Build these sections: - Header/hero with my name and short introduction - About - Projects - Skills - Contact - A small footer Style: - Professional but

approachable - Clean, modern, student-friendly - Dark navy/blue and white with one subtle accent color - Responsive on desktop and mobile - Use cards for projects and skills - Make both GitHub repository links clearly clickable - Do not include fake email addresses, phone numbers, social accounts, employers, awards, statistics, or claims. - Keep the content concise enough for a one-page portfolio. - Generate the complete page as a single index.html file that can be uploaded directly to GitHub Pages.

3. Prompt Refinement Log

Follow-up 1 — Fix project accuracy

Prompt sent: Review the Projects section against my original brief. Keep exactly these three experiences: the Hello World C repository, the pair-programming collaboration using GitLens and Live Share, and the LeetCode solutions repository. Remove any generic or invented project details. Keep the two verified GitHub links unchanged.

What changed: The Projects section was made more accurate and tied directly to Activities 1–4 instead of generic portfolio filler.

Follow-up 2 — Improve About section

Prompt sent: Shorten the About section to three concise sentences. Mention that I am a second-year B.Tech CSIT student in 3rd semester, that I am developing programming/problem-solving skills, and that I am interested in building practical software projects. Do not add unsupported personal claims.

What changed: The About section became shorter, clearer, and more specific to the student profile.

Follow-up 3 — Correct skills and remove invented details

Prompt sent: Review the Skills and Contact sections. Keep only the skills listed in my brief. Do not invent an email address, phone number, LinkedIn profile, employer, certification, award, or social-media account. For Contact, provide a simple GitHub link using my verified username/repository information.

What changed: The page stopped using invented contact details and restricted the skills to the information supplied in the brief.

Follow-up 4 — Final visual/content review

Prompt sent: Do a final review against my complete brief. Make sure the page has About, Projects, Skills, Contact, and footer sections; both GitHub repository links work; the design is responsive; and there is no invented content. Keep it as a single index.html suitable for GitHub Pages.

What changed: The final page was checked against the rubric requirements and prepared as a single GitHub Pages file.

4. Reflection

The biggest improvement came from the final review/refinement prompt because it checked the page against the original brief instead of accepting the first AI output. One important issue to correct was generic or invented portfolio information; the refinement prompts removed unsupported projects and contact details. The final version keeps the actual Hello World and LeetCode repositories and accurately describes the pair-programming collaboration.

5. Submission Checklist

Portfolio brief: 1–2 pages and includes name, semester, branch, bio, Activities 1–4 artifacts, skills, and one learning/career goal.

Initial structured AI generation prompt included.

At least two follow-up refinement prompts included; four are documented here.

Before/after change notes are included for each refinement.

Final index.html contains About, Projects, Skills, Contact, and footer.

Hello World link: <https://github.com/ujjwal200612-sketch/hello-world-c>

LeetCode link: <https://github.com/ujjwal200612-sketch/leetcode-solutions>

Create/open repository: [ujjwal200612-sketch.github.io](https://github.com/ujjwal200612-sketch)

Upload the AI-generated final page as index.html using GitHub web interface: Add file → Upload files → Commit changes.

Open <https://ujjwal200612-sketch.github.io> and verify it loads without errors.

Submit this brief + prompt log + live portfolio URL.
